How do you solve a stoichiometry problem? + Example

When doing stoichiometry with solutions you need to know the concentration of reactants in your solvent. Specifically you need to know the moles per unit of solvent. There are many different ways of doing this, but I'm going to use molarity. Molarity is simply moles per liter. To find molarity of a solution we use $n/L=M$ (M stands for molarity). To use it for stoichiometry arrange it so it looks like $M \cdot L=n$.
