Two main reasons prompted us to investigate the molecular basis of bivalvian eye formation. In the first place, all major eye-types, the compound eye, consisting of numerous ommatidia, the camera eye with a single lens and the mirror eye with a reflecting mirror in the back of the eye, are found in bivalves.

The intention of my PhD project was to

gain more insights into eye evolution and to provide further evidence for the recently proposed idea that all eye-types found in eumetazoans derive from a common Pax6-dependent proto-type eye (Gehring and Ikeo, 1999). To do so, we decided to focus on eyes found in bivalves. Two main reasons prompted us to investigate the molecular basis of bivalvian eye ...

About our work. A major emphasis of this group is to move beyond single gene,

single technology studies in an attempt to integrate genomics, structure and function and evolutionary perspectives to obtain a wider systems view of the molecular biology of the eye. We have made extensive use of genomics and bioinformatics (largely through NEIBank) to gain new insights into the molecular composition of the eye and to identify sets of specific changes in sequence and expression that distinguish ...

Because mutations in vitreous collagens can lead to abnormal eye size and vitreoretinal degeneration, a few congenital vitreoretinopathies provide some molecular insight. Surgical removal of the vitreous can be effective in managing many of these conditions, but the underlying molecular mechanisms remain poorly understood.
