Hodge Decomposition - A Method for Solving Boundary Value ...

This book is a study of the Hodge-Kodaira and related decompositions on manifolds with boundary under mainly analytic aspects. It aims at developing a method for solving boundary value problems. Analysing a Dirichlet form on the exterior algebra bundle allows to give a refined version of the classical decomposition results of Morrey.

Hodge Decomposition—A Method for Solving Boundary Value ...

In mathematics, Hodge theory, named after W. V. D. Hodge, is a method for studying the cohomology groups of a smooth manifold M using partial

differential equations. The key observation is that, given a Riemannian metric on M , every cohomology class has a canonical representative, a differential form which vanishes under the Laplacian operator of the metric. Such forms are called harmonic. The theory was developed by Hodge in the 1930s to study algebraic geometry, and it built on the work of Geo

Numerical Methods for Hodge Decomposition

The Helmholtz-Hodge decomposition establishes that any vector field V can be described as a sum of three orthogonal components: (1) $V = \nabla \phi + \nabla \times \psi + h$, where $\nabla \phi$ is called the curl-free term, $\nabla \times \psi$ is called the divergence-free term and h is called the harmonic term, where ϕ and ψ are the unknowns of the system.

The algorithm. The algorithm of the projection method is based on the Helmholtz decomposition (sometimes

called Helmholtz-Hodge decomposition) of any vector field into a solenoidal part and an irrotational part. Typically, the algorithm consists of two stages. In the first stage, an intermediate velocity that does not satisfy the incompressibility constraint is computed at each time step.

The method is based on novel results for the smooth and discrete
