Foundation of Functional Programming: Error Handling

In computer science,
functional
programming is a
programming
paradigm where
programs are
constructed by
applying and
composing functions. It
is a declarative
programming
paradigm in which
function definitions are
trees of expressions
that each return a

value, rather than a sequence of imperative statements which change the state of the program. In functional programming, functions are treated as first-class citizens, meaning that they can be bound to names, passed as arguments, and returned from

Functional programming - Wikipedia

Foundation is a training course using the Scala programming language, but it also applies to all strongly typed functional programming languages such as Haskell, F# or Elm. The course has three main

goals: Making you familiar with primary Typed FP constructs, Developing your intuition on when and which FP techniques to use and finally, Learning why FP matters to you, your colleagues and your business.
