Digital Signal Processing Developing A

Digital signal processing is the use of digital processing, such as by computers or more specialized
 digital signal processors, to perform a wide variety of signal processing operations. The digital
 signals processed in this manner are a sequence of numbers that represent samples of a continuous
 variable in a domain such as time, space, or frequency. In digital electronics, a digital signal is
 represented as a pulse train, which is typically generated by the switching of a transistor. Digital si

It is not normally appreciated that the development of digital signal processing began because
 designers of analog signal processing systems wished to simulate their performance before building
 expensive prototypes. The obvious tool to perform the simulations on was the digital computer and
 thus began the development of digital signal processing.
