A circuit is a closed path which allows
 electricity to flow from one place to
 another, usually including the source for
 the electricity. Circuits can be made up
 of various electrical components that
 use electricity, but the flow of the

electricity itself will be unimpeded from the source to the end (known usually as the 'ground').

In Simple terms an electronic circuit is a closed pathway for electrons to flow. The Electric Current in a circuit flows from positive to negative while electrons flow from negative to positive. So when the

switch is on the path is complete and electricity passes through enabling the bulb to light up, while when the switch is not on, there is a break in the flow of electricity and the bulb does not light up.

This text is a comprehensive introduction to the topic and, assuming virtually no knowledge, it keeps the mathematical content to a minimum.

Introduction to electric circuits | Ray Powell | download

Electrical circuits consist of the following components: an energy source to provide voltage, conductors to allow current travel, insulators to limit current travel, and a load. Electrical circuits provide an uninterrupted path for

current travel and are broken into two distinct categories of design: series circuits and parallel circuits.

A particular circuit element is available in three grades. Grade A guarantees that the element can safely absorb $1/2W$ continuously. Similarly, Grade B guarantees that $1/4W$ can be absorbed safely, and Grade C guarantees that $1/8W$ can be absorbed safely. As a rule, elements that can safely absorb more power are also more expensive and bulkier.
