Tensor Voting A Perceptual Organization

The tensor voting framework combines these properties and provides a unified perceptual organization methodology applicable in situations that may seem heterogeneous initially. We show how several problems can be posed as the organization of the inputs into salient perceptual structures, which are inferred via tensor voting.

Each token is first decomposed into the basis tensors, and then broadcasts its information. A voting field for each basic component is used to look up the orientation and magnitude of the votes cast. All voting fields are based on the fundamental 2-D stick voting kernel. As seen in Fig. 2 the orientation of the stick vote is normal to the smoothest circular path connecting the voter and receiver that is perpendicular to the normal (the stick) at the voter's location.

Tensor Voting - University of Edinburgh

We show how the perceptual grouping method known as tensor voting can be applied to grey-level images by introducing the use of local orientation tensors computed from a set of Gabor filters. While inputs formerly consisted of binary images or sparse edgel maps, our extension yields oriented input tokens and the locations of junctions as input to the perceptual grouping.

Application of the Tensor Voting Technique for Perceptual ...

The tensor voting framework was designed to offer two possible voting configurations: one that concentrates the votes according to the input orientation (Fig. 3(a) - stick field), and another one that casts votes radially (Fig. 3(b) - ball field), respectively. The voting fields are the composition of all votes that can be cast from a tensor located in the center of the field to its neighboring tensors.

Tensor voting is a perceptual organization framework that has mostly been applied to computer vision problems. Analyzing the estimated local structure at the inputs, we are able to obtain reliable dimensionality estimates at each instance, instead of a global estimate for the entire data set.

(PDF) Tensor Voting - ResearchGate

We have developed a unified computational framework for the inference of multiple salient structures such as junctions, curves, regions, and surfaces from any combinations of points, curve elements, surface elements, in 2-D and 3-D. The methodology is grounded in two elements: tensor calculus for representation, and voting for data communication. The proposed methodology is non-iterative, requires no initial guess or thresholding, and can handle the presence of multiple curves, regions, and ...
