Controller Area Network (CAN) is a serial network technology that was originally designed for the automotive industry, especially for European cars, but has also become a popular bus in industrial

automation as well as other applications. The CAN bus is primarily used in embedded systems, and as its name implies, is a network technology that provides fast communication among microcontrollers up to real-time requirements, eliminating the need for the much more expensive and complex ...

CAN Bus and SAE J1939 Wiring Requirements And Trouble ...

CAN bus uses two dedicated wires for communication. The wires are called CAN high and CAN low. When the CAN bus is in idle mode, both lines carry 2.5V. When data bits are being transmitted, the CAN high line goes to 3.75V and the CAN low drops to 1.25V, thereby generating a 2.5V differential between the lines.

A standard CAN Bus will have a 120 ohm resistor termination at each end of the bus. This is required to avoid reflections that are caused by digital data communications. The resistors act as an “electrical shock absorber” and if they are not fitted correctly, the digital signals will “bounce” off the end of the data Bus, causing noisy reflections.
