What are Ternary Acids? Ternary acids are acidic compounds that contain hydrogen and oxygen combined with another element. The other chemical element is most of the times, a nonmetal. It is a compound composed of hydrogen ion (H^+) bonded to a polyatomic anion. However, a hydrogen ion is the only cation present in ternary acids. Ternary acids are often known

as “oxyacids”.

Home - North Kitsap School District

Ternary Compounds.

Ternary compounds are those containing three different elements. (NaNO₃, NH₄Cl, etc.). The naming of ternary compounds involves the memorization of several positive and negative polyatomic ions, (two or more atoms per ion), and adding these names to

the element with which they combine. i.e., Sodium ion, Na⁺

For ternary ionic compounds.

Ternary acids commonly contain hydrogen, a nonmetal, and oxygen. The name of the most common form of the acid consists of the nonmetal root name with the -ic ending. The acid containing one less oxygen atom than the most common form is designated by the -ous ending.

Formulas of Common Acids and Bases - ThoughtCo

Nomenclature of common acids. This chart provides the nomenclature of some common anions and acids. More complex acids have oxygen in the compound. There is

a simple set of rules for these acids. Any polyatomic ion with the suffix “-ate” uses the suffix “-ic” as an acid. So, HNO_3 will be nitric acid.
