Recombinant Protein Production In Yeast

Recombinant protein production is a multibillion-dollar market. The development of a new product begins with the choice of a production host. While one single perfect host for every protein does not exist, several expression systems ranging from bacterial hosts to mammalian cells have been established.

Although there is a wide range of cell factories that are currently used for recombinant protein production purposes, including bacteria, yeast, fungi, algae, insect cells, and mammalian cells, the bacterium *Escherichia coli* has become the workhorse in this field. This is not only due to the low production costs associated to this prokaryotic expression system, but also to the number of available tools that makes this process easy to implement.

Trends in recombinant protein use in animal production ...

Protein production is the biotechnological process of generating a specific protein. It is typically achieved

by the manipulation of gene expression in an organism such that it expresses large amounts of a recombinant gene. This includes the transcription of the recombinant DNA to messenger RNA, the translation of mRNA into polypeptide chains, which are ultimately folded into functional proteins and may be targeted to specific subcellular or extracellular locations. Protein production systems ar

Protein production - Wikipedia

Yeasts are common hosts for the production of proteins from recombinant DNA. They offer relatively easy genetic manipulation and rapid growth to high cell densities on inexpensive media. As eukaryotes, they are able to perform protein modifications like glycosylation which are common in eukaryotic cells,

but relatively rare in bacteria. Due to this, yeast can produce complex proteins that are identical or very similar to native products from plants or mammals.

Yeast expression platform - Wikipedia

Recombinant protein production is mainly devoted to biopharmaceuticals and industrial enzymes (e.g., for the food, feed, detergent, paper, biofuels, and fine chemical industries). As unicellular eukaryotes, yeasts offer a convenient middle ground recombinant expression system between limited prokaryote hosts and delicate higher eukaryote hosts.

The methylotrophic yeast *Pichia pastoris* is one of the most widely used recombinant protein expression systems. So far more than 5000 proteins have been successfully expressed through this system (<http://www.pichia.com/>). In most situations protein expression relies on the methanol-inducible promoter P AOX1 (alcohol oxidase I promoter).
