A Practical To Pseudospectral Methods

Partial differential equations arise in almost all areas of science, engineering, modeling, and forecasting. During the last two decades pseudospectral methods have emerged as successful alternatives to better known computational procedures, (e.g. finite difference and finite element methods of numerical solution), in several key application areas.

A Practical Guide to Pseudospectral Methods by Bengt Fornberg

FE methods can frequently be seen as a very convenient way to generate and administer complex FD schemes and to obtain results with relatively sharp error estimates. The connection between spectral methods – in particular the so-called pseudospectral (PS) methods, the topic of this book – and FD methods is closer still.

Pseudo-spectral methods, also known as discrete variable representation (DVR) methods, are a class of numerical methods used in applied mathematics and scientific computing for the solution of partial differential equations. They are closely related to spectral methods, but complement the basis by an additional pseudo-spectral basis, which allows representation of functions on a quadrature grid.

A software suite consisting of 17 MATLAB functions for solving differential equations by the spectral collocation (i.e., pseudospectral) method is presented. It includes functions for computing derivatives of arbitrary order corresponding to Chebyshev, Hermite,

Laguerre, Fourier, and sinc interpolants.
