In mathematics, trigonometric identities are equalities that involve trigonometric functions and are true for every value of the occurring variables where both sides of the equality are defined. Geometrically, these are identities involving certain functions of one or more angles .

List of trigonometric identities - Wikipedia

A trigonometric equation is an equation that involves a trigonometric function or functions. When we solve a trigonometric equation we find a value for the trigonometric function and then find the angle or angles that correspond to that particular trigonometric function.

Trigonometric Functions: Cosine of an Angle. Next, we consider the cosine function. The cosine of an angle is the ratio of the adjacent side and hypotenuse side. Cosine is usually abbreviated as cos. Cosine θ can be written as $\cos \theta$. Example:

Calculate the value of $\cos \theta$ in the following triangle. Solution:

Trigonometry Functions (solutions, examples, videos)

In mathematics, the inverse trigonometric functions (occasionally also called arcus functions, antitrigonometric functions or cyclometric functions) are the inverse functions of the trigonometric functions (with suitably restricted domains). Specifically, they are the inverses of the sine, cosine, tangent, cotangent, secant, and cosecant functions, and are used to obtain an angle from any of the angle's trigonometric ratios. Inverse trigonometric functions are widely used in engineering,

We have certain trigonometric identities. Like $\sin^2 \theta + \cos^2 \theta = 1$ and $1 + \tan^2 \theta = \sec^2 \theta$ etc. Such identities are identities in the sense that they hold for all value of the angles which satisfy the given condition among them and they are called conditional identities.
