Cold plasma in materials fabrication : from fundamentals

...

Cold plasma technologies have found extensive application in material processing for over 30 years and they are now widely used in the manufacture of semiconductors, magnetic media and special glasses, and for metal coating, etc. The success of these techniques is related to their ability to change the surface properties of a material by physical or chemical

modification of its most external layers ($\leq 1 \mu\text{m}$), without modifying its bulk characteristics.

Typically, plasmas used for materials

processing and nanotechnology are of relatively low electron density (i.e. number of electrons is less than one millionth of the gas molecules), and are “cold”, meaning that the gas is at a relatively low temperature of 300-500 K, electrons are “hot” with temperature larger than 11600 K (1eV).

A nonthermal plasma,

cold plasma or non-equilibrium plasma is a plasma which is not in thermodynamic equilibrium, because the electron temperature is much hotter than the temperature of heavy species (ions and neutrals). As only electrons are thermalized, their Maxwell-Boltzmann velocity distribution is very different from the ion velocity distribution.
