### **Activity P13: Buoyant Force (Force Sensor)**

In this lab, the buoyant force on an object is measured by taking the difference between the object's weight in air, and its apparent weight in water. This measured buoyant force is compared to the theoretical value

calculated using the object's volume, and Archimedes' Principle.

### **Archimedes' Principle - pasco.com**

The buoyant force on several objects is measured by weighing the water displaced by a submerged object. The buoyant force is also determined by measuring the difference between the object's weight in air and its apparent weight in water. Some of the objects have the same density, some have the same volume, and some have the same mass.

This difference is the buoyant force on the object. To prove or assure that this is the correct force we weighed the displaced water (that spilled into the glass beaker). We subtracted the weight of the empty glass beaker we weighed in the beginning from this new weight. This difference is then recorded as another result of the buoyant force.

Consequently, this buoyant force also relieves stress on joints and muscles for rehabilitating patients. Buoyancy is an upward force in fluids that

counteracts gravity and gives objects the ability to float. This commonly known force is because of the greater pressure of fluid beneath an object that pushes it in an upward direction.
