Fluorescence imaging is a type of non-invasive imaging technique that can help visualize biological processes taking place in a living organism. Images can be produced from a variety of methods including: microscopy, imaging probes, and spectroscopy. Fluorescence itself, is a form of luminescence that results from matter emitting light of a certain wavelength after absorbing electromagnetic radiation. Molecules that re-emit light upon absorption of light are called fluorophores. Fluorescence ima

Time-resolved ("lifetime") fluorescence spectroscopy and imaging provide label-free optical molecular contrast of diseased tissues and outperform steady-state fluorescence. Now proven for in vivo applications, including

noninvasive diagnostics and endoscopy, fluorescence lifetime is promising for clinical work—but depends on advancement of new, more affordable optics and photonics components.
