Growth Factors: Don't Confuse Them with Stem Cells | NSI

...

And since the human body has billions of stem cells, self-repair cells, and other injury response systems, it makes more sense to inject factors that recruit and stimulate these healing cells than to try to inject "stem" cells harvested from fat or bone. Today's injections are mixtures of the strongest growth factors and cytokines.

...

Stem cells can also be encouraged to grow skin-targeted growth

factors by leaving them in the same growth media as a fibroblast. Let's be clear: If you are simply using stem cells, the growth factors that might be made—and there's no guarantee a cell will make growth factors—are less likely to be skin-specific.

Stem Cells and Growth Factors: What You Should Know

Growth factors are produced not just from stem cells, but also from platelets in the blood stream. By taking small amounts of blood and spinning it in a centrifuge, the platelets can be concentrated and induced to release their growth factors. These factors can then be directly injected into a site of injury.

Stem Cells vs. Growth Factors - Kevin R. Stone

Human embryonic stem cells are undifferentiated cells that can develop into any of the specialized cell types found in the human body. Their developmental fate is influenced by the activity of a number of cellular signals, including growth factors.

Study Reveals How Growth Factors Affect Human Stem Cells ...

Growth factors, on the other hand, are actually produced by stem cells themselves, as well as from platelets in the blood stream. The growth factors that originate from stem cells are released when the stem cells reach their

final destination, whereas stem cells in blood platelets need to be obtained by placing the blood in a centrifuge and then injecting that platelet-rich plasma (PRP) back into the body. It has been discovered that the growth factors gathered from blood in a centrifuge are ...

The Difference Between Stem Cells and Growth Factors ...

While scientists have been researching growth factor for decades, these little gems are still somewhat shrouded in mystery. What we do know is that growth factors are substances (either proteins or hormones) that effect the division and growth of the body's cells. They are a component

of stem cells but perform a completely different function.

Understanding peptides, stem cells and growth factors in ...

Recently, at DNA Skin Institute corporate offices, there have been asked many questions in regards to “Stem Cells” that are typically stored in a jar, at room temperature. The small print on these “Stem Cell” products often times reveals that the product does not actually contain Stem Cells, but Growth Factors or Peptides instead.

Stem Cell vs. Peptide vs. Growth Factor — BE:WELL

Essentially, stem cells in skincare are enriched extracts,

containing both proteins and growth factors to deliver nutrients the human body cannot produce alone. What Are Growth Factors? Growth factors can be proteins, small peptides, or steroid hormones.

Growth factors are polypeptides or proteins that bind to specific receptors on the surface of target cells.¹⁴ They can initiate a cascade of intracellular signaling and act in either an autocrine or paracrine manner.¹⁵ Cytokines are typically referred to as immunomodulatory proteins or polypeptides.¹⁶ Cytokines are often used interchangeably with growth factors because many cytokines share similar actions as growth factors.

Effects of Growth Factors on Dental Stem/Progenitor Cells

Background: The number of Mesenchymal Stem/Stromal Cells (MSCs) in the human

bone marrow (BM) is small compared to other cell types. BM aspirate concentration (BMAC) may be used to increase numbers of MSCs, but the composition of MSC subpopulations and growth factors after processing are unknown.

Stem cell factor (also known as SCF, KIT-ligand, KL, or steel factor) is a cytokine that binds to the c-KIT receptor . SCF can exist both as a transmembrane protein and a soluble protein . This cytokine plays an important role in hematopoiesis (formation of blood cells), spermatogenesis , and melanogenesis .
