Schottky diodes . Schottky diodes are constructed of a metal-to-N junction rather than a P-N semiconductor junction.Also known as hot-carrier diodes, Schottky diodes are characterized by fast switching times (low reverse-recovery time), low forward voltage drop (typically 0.25 to 0.4 volts for a metal-silicon junction), and low junction capacitance.. Perfectly efficient diodes appear to be open circuits with a negative voltage and they look like short circuits otherwise. But because diodes admit to some inefficiency, their current-to-voltage relationship is nonlinear. As such, you'll want to consult a diode's datasheet to see a graph of the curve of any given diode's forward voltage ...

What Are Diodes and What Are They Used For?

Zener Diodes. Zener diodes also become useful when it comes to achieving a lower voltage from a higher source, however you cannot get sufficient current from a zener diode voltage clamp.

This happens because zener diodes normally involve a high value resistor for protecting itself from high currents, which restricts the passage of higher ...

Three-phase full-wave bridge rectifier circuit. Each three-phase line connects between a pair of diodes: one to route power to the positive (+) side of the load, and the other to route power to the negative (-) side of the load. Polyphase systems with more than three phases are easily accommodated into a bridge rectifier scheme.

The diode must immediately enter into forward conduction mode as the driving current is interrupted. Most ordinary diodes, even "slow" power silicon diodes, are able to turn on very quickly, in contrast to their slow reverse recovery time. These are sufficient for snubbing electromechanical devices such as relays and motors.

Diodes are usually used to construct different types of rectifier circuits such as half-wave, full-wave, center-tapped and full bridge rectifiers. One of its main application is the rectification of AC power to DC power. During the positive half cycle of the input supply, the anode turns positive with respect to cathode.

So left circuit is for Schottky diode, and the right one is for a typical PN-junction diode. Both diodes are powered with 5V. When current is passed from both diodes, Schottky diode only has a 0.3-volt voltage drop and leave 4.7 volts for the load, on the other hand, typical PN-junction diode has a voltage drop of 0.7 volts and leaves 4.3 volts for load. So Schottky diode has a lower voltage drop than a conventional PN-junction diode.
