Hypothesis tests with the general linear model can be made in two ways: multivariate or as several independent univariate tests. In multivariate tests the columns of Y are tested together, whereas in univariate tests the columns of Y are tested independently, i.e., as multiple univariate tests with the same design matrix.

The specification of the generalized multivariate linear model provides a flexible framework for checking residuals in modeling

normal longitudinal data. The development of this approach is based on the thought that the effect of serial correlation is dominated by the combination of the random intercept and random errors, and therefore, inclusion of more random effect terms is unnecessary.
