Radar uses electromagnetic energy pulses in much the same way, as shown in Figure 1. The radio-frequency (rf) energy is transmitted to and reflected from the reflecting object. A small portion of the reflected energy returns to the radar set. This returned energy is called an ECHO, just as it is in sound terminology.

Single curved parabolic antennas. Single curved means that a parabolic curvature exists only in one dimension. Thus this

antenna does not have a focal point but a focal line. The reflector has a rather cylindrical shape and is fed by a row of single radiators arranged on this focal line. By feeding of every single radiator with a weighted fraction of the transmitting power (e.g. according to Taylor or Gauss), this has the advantage that this antenna gets smaller sidelobes.

These antennas usually consist of a waveguide with many slotted antennas milled into one of its walls. Depending on the length of the antenna, a very narrow horizontal half-power beamwidth may be achieved. Vertically, these antennas have a very wide antenna pattern. These antennas are commonly used for maritime navigation radars.
