A scalar is an element of a field which is used to define a vector space. A quantity described by multiple scalars, such as having both direction and magnitude, is called a vector. In linear algebra, real numbers or other elements of a field are called scalars and relate to vectors in a vector space through the operation of scalar multiplication, in which a vector can be multiplied by a number to produce another vector. More generally, a vector space may be defined by using any field instead of

Scalar and Vector Algebra. Scalars: Scalars are mathematical entities which have only a magnitude (and no direction). Physical examples include mass and energy. . Vectors: Vectors are mathematical entities which have both a magnitude and a direction. Note that the location of the vector (for example, on which point a specific vector force is acting, or where a car with a given vector velocity is located) is not part of the vector itself.

The term "scalar" is used to mean some element of a field, usually clear from context. Here, the field is clearly C, and hence c must not be real, so the statement is false since c can be complex. For example, c = i and A = (1 1 0 1) provides a counter-example (verify that this is indeed a counter-example). If c is real, the statement is true.
