Answered November 23, 2018 · Author has 6.4K answers and 3M answer views. Any competent motor winding shop should be able to do it easily, since the three phase windings for a given Kw rating are more compact than the ones for a single phase motor. To do it yourself without the sorts of information resources a winding shop has, you would need to 1) Measure the resistance of the single phase winding and decide what 3 phase voltage you want to run on 2) compute the estimated current required

A three-phase motor must be wired based on the diagram on the faceplate. The first step is to figure out the voltage of your phases. In the United States, for low voltage motors (below 600v), you can expect either 230v or 460v. That being said, there is a wide range of different motors and what you have on hand can be completely different. Make sure that the voltage you will be supplying to your motor matches the specifications on the faceplate.
