The Universal Coded Character Set is a standard set of characters defined by the International Standard ISO/IEC 10646, Information technology — Universal Coded Character Set, which is the basis of many character encodings, improving as characters from previously unrepresented writing systems are added. The UCS has over 1.1 million possible code points available for use/allocation, but only the first 65,536 had entered into common use before 2000. This situation began changing when the ...

Universal Coded Character Set - Wikipedia

In computing, data storage, and data transmission, character encoding is used to represent a repertoire of characters by some kind of encoding system that assigns a number to each character for digital representation. Depending on the abstraction level and context, corresponding code points and the resulting code space may be regarded as bit patterns, octets, natural numbers, electrical pulses, etc. A character encoding is used in computation, data storage, and transmission

Coded Character Sets History And Development

Ironically, three of the newly added characters (Æ, œ, and Ÿ) had already been present in DEC's 1983 Multinational Character Set (MCS), the predecessor to ISO/IEC 8859-1 (1987). Since their original code points were now reused for other purposes, the characters had to be reintroduced under different, less logical code points.

ISO/IEC 8859-1 - Wikipedia

ASCII (/ ' æ s k i: / ASS-kee),: 6 abbreviated from American Standard Code for Information Interchange, is a character encoding standard for electronic communication. ASCII codes represent text in computers, telecommunications equipment, and other devices. Most modern character-encoding schemes are based on ASCII, although they support many additional characters.

ASCII - Wikipedia

UTF-8 can encode any Unicode character, avoiding the need to figure out and set a "code page" or otherwise indicate what character set is in use, and allowing output in multiple scripts at the same time. For many scripts there have been more than one single-byte encoding in usage, so even knowing the script was insufficient information to display it correctly.

UTF-8 - Wikipedia

This is a list of Unicode characters; there are 143,859 characters, with Unicode 13.0, covering 154 modern and historical scripts, as well as multiple symbol sets. As it is not technically possible to list all of these characters in a single Wikipedia page, this list is limited to a subset of the most important characters for English-language readers, with links to other pages which list the supplementary characters.
