The simplest arrangement is a small number of radial blades, but the impeller commonly used in air-conditioning systems and in small ventilation units has a large number of smaller blades curved in the direction of rotation. The primary source of noise occurs at blade passage frequency because of the passage of impeller blades past the cutoff.

The minimum radial force occurred at the design flow rate, while the radial forces increased, when the pump runs at off-design conditions. The radial force increased as the flow rate decreased. The radial forces and their fluctuations were relatively large at a flow rate of $0.6Q_d$. Theoretically, the velocity and pressure of fluid in the spiral volute around the impeller are uniform and axisymmetric, and the radial force on the impeller is zero at the design flow rate.
