Chemistry Of Coal

Coal is a combustible black or brownish-black sedimentary rock, formed as rock strata called coal seams. Coal is mostly carbon with variable amounts of other elements; chiefly hydrogen, sulfur, oxygen, and nitrogen. Coal is formed when dead plant matter decays into peat and is converted into coal by the heat and pressure of deep burial over millions of years.

Coal - Wikipedia

Bituminous (low, medium, and high volatile) coal, a soft coal that produces smoke and ash when burned, has a 46–86 percent fixed-carbon content and a heating value of 11,000–15,000 Btu/lb (11.6–15.8 million joules/lb). It is the most abundant economically recoverable coal globally and the main fuel burned in steam turbine-powered electric generating plants.

Andrew Szydlo's Chemistry of Coal - YouTube

Coal is formed mainly by geological processes. It is a type of fossil fuel created from the remains of dead plants many years ago. It has been classified as a nonrenewable energy source. Further, coal is composed of elements like carbon, sulphur, hydrogen, nitrogen and oxygen amongst others.

Uses of Coal - Industrial and Domestic Uses of Coal

Although coal is an extremely complex and heterogeneous material, many of its fundamental properties can be determined by the coordinated efforts of organic and physical chemists, solid state physicists, and chemical engineers. The scientific questions that emerge from these efforts lie at the frontiers of chemistry and physics research.

The Chemistry and Technology of Coal, Third Edition maintains its initial premise: to introduce the science of coal, beginning with its formation in the ground to the production of a wide variety of products and petrochemical intermediates in the twenty-first century. The book will prove useful for scientists and engineers already engaged in the coal and/or catalyst manufacturing industry looking for a general overview or update on the clean coal technology as well as professional ...

The Chemistry and Technology of Coal - 3rd Edition - James ...

Four general methods are used for liquefaction: (1) pyrolysis and hydrocarbonization (coal is heated in the absence of air or in a stream of hydrogen), (2) solvent extraction (coal hydrocarbons are selectively dissolved and hydrogen is added to produce the desired liquids), (3) catalytic liquefaction (hydrogenation takes place in the presence of a catalyst—for example, zinc chloride), and (4) indirect liquefaction (carbon monoxide and hydrogen are combined in the presence of a catalyst).
