Fatigue is a major cause of failure, particularly in welded structures, reflecting the inherently poor fatigue performance of many welded joints (Fig.1).This emphasises the need for due consideration of potential fatigue failure at the design stage, and for clear design guidance. In fact, considerable effort has gone into the production or revision of fatigue design rules in recent years, particularly in the European Union in view of the adoption of common Standards.

Fatigue in Welded-Steel Structures | Machine Design

Welding is a manufacturing method used to join various materials in order to form an assembly. During welding, joints are formed between two or more separate pieces of material. A welded joint subjected to cyclic loading could fail due to fatigue. Fatigue results from this cyclic loading, as well as strains, in the material. Throughout a welded assembly's life, cracks, which reduce the fatigue life of a joint, could initiate, propagate, and grow causing the assembly to fail even if these cyclic

Current ship standards are limited to S460 structural steel, however, and maritime structures are often made of normal-strength or mild-strength steel since fatigue strength of welded joints shows only minor or no influence of the base material strength. 15 By analysing large data sets of fracture toughness tests, Walters et al 16 showed that mild strength steel often fulfils the requirements for much lower temperatures than required.
