Bootstrapping linear regression ¶ We've talked about correcting our regression estimator in two contexts: WLS (weighted least squares) and GLS. Both require a model of the errors for the correction. In both cases, we use a two stage procedure to "whiten" the data and use the OLS model on the "whitened" data.

Bootstrapping for Linear Regression (Inference for the True Coefficients) ¶. Recall that in linear regression, we fit a model of the following form  $f(x) = \theta_0 + \theta_1 x_1 + \dots + \theta_p x_p$ . We would like to infer the true coefficients of the model. Since the  $\theta_0, \theta_1, \dots, \theta_p$  are estimators that vary based on our training data/observations, we would like to understand how our estimated coefficients compare with the true coefficients.
