Stripline is a TEM (transverse electromagnetic) transmission line media, like coax. The filling factor for coax is unity, and "Keff" is equal to ER. This means that it is non-dispersive. Whatever circuits you can make on microstrip (which is quasi-TEM), you can make better using stripline, unless you run into fabrication or size constraints.

A stripline circuit uses a flat strip of metal which is sandwiched between two parallel ground planes. The insulating material of the substrate forms a dielectric. The width of the strip, the thickness of the substrate and the relative permittivity of the substrate determine the characteristic impedance of the strip which is a transmission line.
