Fourier series can be named a progenitor of Fourier Transform, which, in case of digital signals (Discrete Fourier Transform), is described with formula: $X(k) = \frac{1}{N} \sum_{n=0}^{N-1} x(n) \cdot e^{-j2\pi Nkn}$. Fourier transformation is reversible and we can return to time domain by calculation: $x(n) = \sum_{k=0}^{N-1} X(k) \cdot e^{j2\pi Nkn}$.

Analog and digital signals are used to transmit information, usually through electric signals. In both these technologies, the information, such as any audio or video, is transformed into electric signals. The difference between analog and digital technologies is that in analog technology,

information is translated into electric pulses of varying amplitude.

ECE 362: Digital Signal Processing. Digital signal processing is the mathematical manipulation of a discrete-domain information signal to modify or improve it in some way. This course provides an introduction to fundamental concepts in digital signal processing. Topics include sampling and reconstruction, discrete-time signals and linear time-invariant systems, the z-Transform, discrete-time Fourier transform,

fast Fourier transform, and discrete-time filters.
