Elimination can be used to solve a system of equations by adding terms vertically. This will cause one of the variables to be eliminated. It may be necessary to multiply one or both equations by some number to use this method. I. Elimination may require no change to either equation.  $\begin{cases} 3x + y = 6 \\ 5x + 10y = 16 \end{cases}$  Adding vertically will  $\begin{matrix} 3x & + & y & = & 6 \\ 10x & + & 10y & = & 16 \\ \hline 13x & + & 11y & = & 22 \end{matrix}$

### Solving Systems Multiplication - Teacher Worksheets

Substitute  $-2y + 6$  for  $x$  in the first equation to get  $3(-2y + 6) - 2y = 10$ . Solve this for  $y$  to get  $y = 1$ . Then substitute 1 for  $y$  in either original equation to get  $x = 4$ , for a solution of  $(4, 1)$ . The elimination method is more efficient because there are fewer calculations and they are simpler to do.

Eliminate one of the variables to get the value of the other variable. In (1) and (2), both the variables  $x$  and  $y$  are not having the same coefficient. One of the variables must have the same coefficient. So multiply both sides of (1) by 2 to make the coefficients of  $y$  same in both the equations.
