In this paper, we propose a nonparametric change point test for multivariate data using rankings obtained from data depth measures. As the data depth of an observation measures its centrality relative to the sample, changes in data depth may signify a change of scale of the underlying distribution, and the proposed test is particularly responsive to detecting such changes.

The extensive development of data depth in recent years has spawned attractive depth-based tools for nonparametric multivariate data analysis, with a wide range of applications. The diversity in approaches, emphases, and concepts, however, makes it necessary to seek unified views and perspectives that would guide the further development of the depth-based approach.

Title: Data Analysis by Zonoid Depth The zonoid depth is useful in multivariate data analysis in order to describe an empirical distribution by trimmed regions, so-called zonoid regions. The zonoid regions range from the convex hull of the data to their mean and characterize the distribution in a unique way.

Abstract. A data depth can be used to measure the “depth” or “outlyingness” of a given multivariate sample with respect to its underlying distribution. This leads to a natural center-outward ordering of the sample points. Based on this ordering, quantitative and graphical methods are introduced for analyzing multivariate distributional characteristics such as location, scale, bias, skewness and kurtosis, as well as for comparing inference methods.

The idea of depth for multivariate data provides a way of measuring how representative or central an observation is within a sample. For a given sample or distribution P, a notion of depth assigns for every observation x a real number D(x,P) satisfying that the closer a point is to the mass center the higher its depth is.

The data depth concept provides center-outward ordering of points in any dimension and leads to a new non-parametric multivariate statistical analysis in which no distributional assumptions are needed. Since 1975, when Tukey (1975) introduced the location depth, many more depth functions have been proposed.

The Concept of Depth In Statistics

Robust statistics are statistics with good performance for data drawn from a wide range of probability distributions, especially for distributions that are not normal. Robust statistical methods have been developed for many common problems, such as estimating location, scale, and regression parameters. One motivation is to produce statistical methods that are not unduly affected by outliers. Another motivation is to provide methods with good performance when there are small departures from param

As the relation between data depth D (.) and the multivariate spatial rank RF (.) would be given by D (x)= 1-|| RF (x)||, a measure of outlyingness can be defined using ||R F (x)||. It can be verified that this outlyingness function is invariant under orthogonal and homogeneous scale transformations.
