Density (g/mL) = mass (g)/volume (mL) If you were to make two solutions, one with 1.0g of NaCl in 100 mL of and one with 3.5g of NaCl in 100 mL of solution, the second solution would have a greater density because more solute is dissolved in the solution (even though the final volumes are the same).

First instinct, is to add the mass of the salt to mass of the water e.g. a solubility of 80 g of salt in 100 m L would have a solution density of 180 g / 100 m L = 1.8 g / m L. However, it seems the salt should affect the volume of the solution. What additional information is needed or does this quantity just have to be empirically determined?

The more salt that is mixed into a measured amount of water, the higher the density of the solution. The molar volume of a salt can be calculated from the measured densities of a salt solution and of pure water: where V_m is the molar volume of the salt (cm³/mol), m is the molality (mol/kg H₂O), MW is the molecular weight of the salt (g/mol), and ρ and ρ_0 are the densities of the solution and of pure water at the same pressure and temperature, respectively (g/cm³).

Aqueous molar volumes and density of solutions

A salt solution, also called a saline solution, is simply a mixture of salt and water. Salt is the solute (the dissolving substance), and water is the solvent (the substance that dissolves another to create a solution). To make a salt solution by weight percent (w/v), you apply the formula $w/v = (\text{mass of solute} \div \text{volume of solution}) \times 100$. The density of water is 1 gram per milliliter (g/ml) which means

1 milliliter of water weighs 1 gram.

For salts that have a positive slope of apparent water density with concentration, a maximum in apparent density as a function of concentration is generally observed depending on the solubility range. Apparent density maxima at room temperature are more frequently observed with polyvalent electrolytes.

Salt weighs 2.17 gram per cubic centimeter or 2 170 kilogram per cubic meter, i.e. density of salt is equal to 2 170 kg/m³; at 20°C (68°F or 293.15K) at standard atmospheric pressure. In Imperial or US customary measurement system, the density is equal to 135.469 pound per cubic foot [lb/ft³], or 1.25 ounce per cubic inch [oz/inch³].

Density of Salt in 285 units and reference information

The density of solutions increases with the concentration of dissolved solids in the solution. You will use this fact to determine relative concentrations of salt solutions. Chemistry is the study of matter, which is usually defined as anything that has mass and volume. You already have some experience determining mass and volume in the lab.
