Types of Optimization Problems • Some problems have constraints and some do not. • There can be one variable or many. • Variables can be discrete (for example, only have integer values) or continuous. • Some problems are static (do not change over time) while some are dynamic (continual adjustments must be made as changes occur).

forms of investments. Moreover, it is often useful to assume that the time horizon is infinite. This makes dynamic optimization a necessary part of the tools we need to cover, and the first significant fraction of the course goes through, in turn, sequential maximization and dynamic programming. We assume throughout that time is discrete,

Dynamic Programming Perspective. The dynamic programming perspective says that optimal control is a problem of choosing the right action at each step. In discrete settings with known dynamics, we can solve this dynamic programming problem exactly. For example, Q-learning estimates the state-action values, $Q(s, a)$ by iterating the following updates:

Simulation-based optimization - Wikipedia

Dynamic programming (DP) is a widely-used mathematical

method for solving linear and nonlinear optimization problems. The term "dynamic" originates from the fact that in most applications, the method is used to derive a sequence of optimal decisions that are adapted to scenario changes that occur dynamically over time.
