Factoring polynomials is done in pretty much the same manner. We determine all the terms that were multiplied together to get the given polynomial. We then try to factor each of the terms we found in the first step. This continues until we simply can't factor anymore.

Summary of Factoring Techniques. For all polynomials, first factor out the greatest common factor (GCF). For a binomial, check to see if it is any of the following: difference of squares: $x^2 - y^2 = (x + y)(x - y)$ difference of cubes: $x^3 - y^3 = (x - y)(x^2 + xy + y^2)$ sum of cubes: $x^3 + y^3 = (x + y)(x^2 - xy + y^2)$

The factoring is a method through which a polynomial is expressed in the form of multiplication of factors, which can be numbers, letters or both. To factorize the factors that are common to the terms are grouped, and in this way the polynomial is decomposed into several polynomials. Thus, when the factors multiply each other the result is the

original polynomial.

The first step is to identify the polynomial type in order to decide which factoring methods to use. Next, look for a common term that can be taken out of the expression. A statement with two terms can be factored by a difference of perfect squares or factoring the sum or difference of cubes. For the case with four terms, factoring by grouping is the most effective way.
