The Biology of Aging. Introduction. Aging is both inevitable and universal. As people age they change in a myriad of ways - biologically, psychologically and physiologically. Data from the US Census Bureau show that in 2008 there were 39 million Americans 65 years of age and older, a dramatic increase from the 3 million in 1900.

The Biology of Aging

A few studies that have followed cohorts of people longitudinally as they age have shown differing results. 1 For example, cardiac function in older people free of heart disease does not show inevitable decline with age. 2 Degenerative

The Biology of Aging: An Overview

Comparative Biology of Aging presents trends found in comparative studies of aging. The Evolutionary Theory of Aging debates the models and hypotheses put forward to explain how aging evolved. Human Aging Model Systems introduces and discusses the different model organisms used

to study human aging.

Senescence, Longevity and the Biology of Aging

Age is the main risk factor for the development of age-related diseases, such as dementia, Alzheimer's disease, cardiovascular diseases, Parkinson's disease and cancer. With our research we want to understand why almost all living beings age and become more susceptible to diseases in old age. At the same time, we are investigating which factors promote healthy ageing and how the ageing process can be influenced.

Bio Eats World: The Biology of Aging - Andreessen Horowitz

In the broader sense, ageing can refer to single cells within an organism which have ceased dividing (cellular senescence) or to the population of a species (population ageing). In humans, ageing represents the accumulation of changes in a human being over time and can encompass physical, psychological, and social changes.
