Solving Nonlinear Partial Differential Equations

In mathematics and physics, a nonlinear partial differential equation is a partial differential equation with nonlinear terms. They describe many different physical systems, ranging from gravitation to fluid dynamics, and have been used in mathematics to solve problems such as the Poincaré conjecture and the Calabi conjecture. They are difficult to study: there are almost no general techniques that work for all such equations, and usually each individual equation has to be studied as a separate

The Adomian decomposition method is a semi-analytical method for solving ordinary and partial nonlinear differential equations. The method was developed from the 1970s to the 1990s by George Adomian, chair of the Center for Applied Mathematics at the University of Georgia. It is further extensible to stochastic systems by using the Ito integral. The aim of this method is towards a unified theory for the solution of partial differential equations; an aim which has been superseded by the more gene

Integrating both sides leads to $\log u = Z du/u = Z (1-2t)dt = t-t^2 + k$, where k is the constant of integration. We can readily solve for $u(t) = ce^{t-t^2}$, where $c = \pm ek$. The latter formula constitutes the general solution to the differential equation, and happens to include the equilibrium solution $u(t) \equiv 0$ when $c = 0$.
