Non-Parametric Tests. Non-parametric tests are commonly used when the data is not normally distributed. These tests are considered to be a type of transformation because they are mostly equivalent to their parametric counterparts, except that the data has been converted to ranks (1, 2, 3, ...) from the lowest to the highest value.

Non-parametric statistics are used when the parameters of the population are not measurable or do not meet certain standards. In cases when the data only order the observations, so that the interval between the observations is unknown, neither a mean nor a variance can be meaningfully computed. In such cases, you need to use non-parametric tests.

Chapter 7: Non-parametric models

Nonparametric statistics is the branch of statistics that is not based solely on parametrized families of probability distributions (common examples of parameters are the mean and variance). Nonparametric statistics is based on either being distribution-free or having a specified distribution but with the distribution's parameters unspecified.

Nonparametric statistics includes both descriptive statistics and statistical inference. Nonparametric tests are often used when the assumptions of parametric

There are several advantages of using

nonparametric statistics. As can be expected, since there are fewer assumptions that are made about the sample being studied, nonparametric statistics are usually wider in scope as compared to parametric statistics that actually assume a distribution. Nonparametric statistics - Wikipedia

Inferential statistics are calculated with the purpose of generalizing the findings of a sample to the population it represents, and they can be classified as either parametric or non-parametric. Parametric tests make assumptions about the parameters of a population, whereas nonparametric tests do not include such assumptions or include fewer.

The χ^2 test is a non-parametric test which is most commonly used to test whether the proportion of people with or without a certain characteristic differs between two or more independent groups.
