In the mathematical field of representation theory, group representations describe abstract groups in terms of bijective linear transformations (i.e. automorphisms) of vector spaces; in particular, they can be used to represent group elements as invertible matrices so that the group operation can be represented by matrix multiplication. Representations of groups are important because they allow ...

Group representation - Wikipedia

$M_{m,n}(K)$ denotes the K -vector space of $m \times n$ matrices $A = (a_{ij})$ with $a_{ij} \in K$ ($i = 1, \dots, m, j = 1, \dots, n$) and $M_n(K)$ stands for $M_{n,n}(K)$. Our groups will be (for some n) subgroups of the general linear group of invertible $n \times n$ -matrices $GL(n, K) := \{A \in M_n(K); \det A \neq 0\}$.

Contents. Metrics. Book description. The most important examples of finite groups are the group of permutations of a set of n objects, known as the symmetric group, and the group of non-singular n -by- n matrices over a finite field, which is called the general linear group. This book examines the representation theory of the general linear groups, and reveals that there is a close analogy with that of the symmetric groups.

Definition Linear representations. Let V be a k -vector space and G a finite group. A linear representation of a finite group G is a group homomorphism $\rho: G \rightarrow \text{GL}(V)$. Here $\text{GL}(V)$ is notation for a general linear group, and $\text{Aut}(V)$ for an automorphism group. This means that a linear representation is a map $\rho: G \rightarrow \text{GL}(V)$ which satisfies $\rho(g) = \rho(hgh^{-1})$ for all $g, h \in G$. The vector space V is called representation space of G .

$\pi(gg') = \pi(g)\pi(g')$ for all $g, g' \in G$. $\text{Aut}(V)$ is equivalently denoted by $\text{GL}(V)$ and stands for the group of all (linear) isomorphisms of V . In the case of a finite-dimensional vector space V , say of dimension n , one says that π is of degree n or is an n -dimensional representation. 8 1.

It describes the correspondence, due to Frobenius, between linear representations and characters. This is a fundamental result, of constant use in mathematics as well as in quantum chemistry or physics. I have tried to give proofs as elementary as possible, using only the definition of a group and the rudiments of linear algebra.

1.5 Definition. A linear representation ρ of G on a complex vector space V is a set-theoretic action on V which preserves the linear structure, that is, $\rho(g)(v_1 + v_2) = \rho(g)v_1 + \rho(g)v_2, \forall v_1, v_2 \in V, \rho(g)(kv) = k \cdot \rho(g)v, \forall k \in \mathbb{C}, v \in V$. Unless otherwise mentioned, representation will mean finite-dimensional complex representation.
