Bias Correction Of Satellite Rainfall

Overall, bias-corrected satellite rainfall products are expected to better match station records compared to satellite only products even in complex terrain and as such correction should improve hydrological applications by improved rainfall representation.

Effect of Bias Correction of Satellite-Rainfall Estimates ...

We demonstrate this method using two satellite-based products, CPC Morphing (CMORPH) and Hydro-Estimator (HE), and a radar-gauge rainfall Stage-IV (ST-IV) dataset for several rain events in 2006 over Oklahoma. The method was compared with 3 simpler methods for bias correction: mean ratio, maximum ratio and spatial interpolation without ensembles. Bias ratio, correlation coefficient, root mean square error and mean absolute difference are used to evaluate the performance of the different methods.

The systematic differences of these rainfall products from gauge observations can be partially compensated by adopting a bias (error) correction. Many of such methods correct the satellite based rainfall data by comparing their mean value to the mean value of rain gauge data.

There are numerous bias correction techniques in which a transfer function, derived from the direct comparison between ground-based estimates and satellite-based products, is applied to the satellite data (e.g., Condom et al. 2011; Wanders et al. 2015; Yang et al. 2016). In these techniques, a correction model is developed based upon the historical data for a particular area and is then applied to the satellite data.

ABSTRACT. Bias correction in the weather radar and the tropical rainfall measuring mission (TRMM) rainfall estimates are used to improve its accuracy. This correction is usually done separately for both radar and TRMM. Even though the corrections are done separately, the results of these corrections can be further improved using the merging.

Bias-Corrected CHIRP Satellite Rainfall for Water Level Simulation, Lake Ziway, Ethiopia. Applicability of satellite rainfall products must be explored since rain gauge networks have limitations to provide adequate spatial coverage. In this study, Climate Hazards InfraRed Precipitation (CHIRP) satellite-only product was evaluated for rainfall-runoff modeling whereas the simulated runoff served as input to simulate the water levels of Lake Ziway from 1986 to 2014.

It can be observed that the TVSF bias correction scheme improved the linear association of the four SREs with the reference rain gauge data as observed through the increase in the R 2.. For example, the R 2 of the uncorrected four SREs at Ghanzi ranged from 0.18 to 0.19 but after bias-correction improved to 0.20 to 0.81 . The same trend was observed in other, eight rain gauge sites.
