Space-time block coding is a technique used in wireless communications to transmit multiple copies of a data stream across a number of antennas and to exploit the various received versions of the data to improve the reliability of data transfer. The fact that the transmitted signal must traverse a potentially difficult environment with scattering, reflection, refraction and so on and may then be further corrupted by thermal noise in the receiver means that some of the received copies of ...

Space-time block coding (STBC) is mainly used to gain on robustness and reliability. Multiple radio chains will be used to send multiple times the same data or the bits of the same data over different antennas. This ensures that the same data is sent through different paths and it will also be received different times

on multiple antennas.
