Processing Magnetotelluric Data With Modern

Although modern magnetotelluric (MT) data are highly multivariate (multiple components, recorded at multiple stations), commonly used processing methods are based on univariate statistical procedures. Here we develop a practical robust processing scheme which is based on multivariate statistical methods. With this approach we use data from all channels to improve signal-to-noise ratios, and to diagnose possible biases due to coherent noise.

In the magnetotelluric (MT) method (see Magnetotelluric Interpretation), data processing generally refers to the initial analysis steps required to use naturally occurring time variations of electromagnetic (EM) fields measured at the surface to map the distribution of electrical conductivity within the Earth (see Geoelectromagnetism).The data are acquired as time series, generally including ...

The processing of magnetotelluric data involves concepts from electromagnetic theory, time series analysis and linear systems theory for reducing natural electric and magnetic field variations recorded at the earth's surface to forms suitable for studying the electrical properties of the earth's interior. The electromagnetic field relations lead to either a scalar transfer impedance which couples an electric component to an orthogonal magnetic component at the surface of a plane-layered ...

In standard MT data processing routines, the Fourier transform is used to determine the spectra (e.g. Sims 1971; Vozoff 1972) and impedance estimates are determined through a combination of methods like remote reference (e.g. Gamble 1979a, b), multitaper spectral analysis (Thomson 1982), robust estimates (e.g. Egbert & Booker 1986; Chave & Thomson 1989) and bounded-influence remote reference processing, BIRRP (Chave & Thomson 2004). In particular, the latter modern MT processing codes have ...

Taking Magnetotelluric Data out of the Drawer - Eos

Magnetotellurics is an electromagnetic geophysical method for inferring the earth's subsurface electrical conductivity from measurements of natural geomagnetic and geoelectric field variation at the Earth's surface. Investigation depth ranges from 300 m below ground by recording higher frequencies down to 10,000 m or deeper with long-period soundings. Proposed in Japan in the 1940s, and France and the USSR during the early 1950s, MT is now an international academic discipline and is used in expl

A major step in processing magnetotelluric (MT) data is the calculation of an impedance tensor as function of frequency from recorded time-varying electromagnetic fields. Common signal processing techniques such as Fourier transform based procedures assume that the signals are stationary over the record length, which is not necessarily the case in MT, due to the possibility of sudden spatial and temporal variations in the naturally occurring source fields.

Moorkamp, Max. Abstract. A major step in processing magnetotelluric (MT) data is the calculation of an impedance tensor as function of frequency from recorded time-varying electromagnetic fields. Common signal processing techniques such as Fourier transform based procedures assume that the signals are stationary over the record length, which is not necessarily the case in MT, due to the possibility of sudden spatial and temporal variations in the naturally occurring source fields.

Data processing of magnetotelluric (MT) survey has been applied frequency by frequency based on the Fast Fourier Transform (FFT), since the FFT gives us the response functions (RFs) of the earth in the frequency domain directly. However, applying FFT processing to MT data may not be optimum. It is because the MT data is in general non-stationary since the source of MT is the transient ...
