This second edition of our book extends the modeling and calculation of boundary-layer flows to include compressible flows. The subjects cover laminar, transitional and turbulent boundary layers for two- and three-dimensional incompressible and compressible flows. The viscous-inviscid coupling between the boundary layer and the inviscid flow is also addressed.

The finite element method formulation of a boundary value problem finally results in a system of algebraic equations. The method approximates the

unknown function over the domain. The simple equations that model these finite elements are then assembled into a larger system of equations that models the entire problem.

Computers are used to perform the calculations required to simulate the free-stream flow of the fluid, and the interaction of the fluid (liquids and gases) with surfaces defined by boundary conditions. With high-speed supercomputers, better solutions can be achieved, and are often required to solve the largest and most complex problems.

Modeling in courses that incorporate computation can help students better understand physical systems. Conceptualizing a model gives students the opportunity to define inputs/outputs, conservative quantities, discretization, and boundary and initial conditions. In addition, students evaluate assumptions and make predictions--important skills transferable through STEM.

These boundary conditions represent flux boundaries, where flow enters or leaves the 2D flow area. (Boundary conditions can also be defined within the interior of the 2D flow area, to represent additional discharge that enters the 2D flow area—such as flow from a wastewater treatment plant.) Examples of flux boundaries are: Inflow hydrograph

Numerical weather prediction (NWP) uses mathematical models of the atmosphere and oceans to predict the weather based on current weather conditions. Though first attempted in the 1920s, it was not until the advent of computer simulation in the 1950s that numerical weather predictions produced realistic results. A number of global and regional forecast models are run in different countries ...
