Un array (o arreglo) es una estructura de datos con elementos homogéneos, del mismo tipo, numérico o alfanumérico,

reconocidos por un nombre en común. Para referirnos a cada elemento del array usaremos un índice (empezamos a contar por 0). Declaración de arrays. Para declarar un array tenemos que ejecutar dos instrucciones:

En este post vamos a hablar acerca de

tres estructuras de datos fundamentales en el manejo de colecciones, conocidas por casi todos los programadores: los arreglos, las pilas (stacks) y las colas (queues).

Estructuras de Datos[3] - Arreglos, pilas y colas

Las estructuras de datos tienen en común que un identificador, nombre, puede representar a múltiples datos individuales. Un arreglo (array) es una colección de datos del mismo tipo, que se almacenan en posiciones consecutivas de memoria y reciben un nombre común.

Estructuras y Arreglos. Un arreglo es una secuencia de posiciones de memoria a las que se puede acceder directamente que almacenan valores del mismo tipo, los cuales se identifican por su posición, que en pseudocódigo comienza en 1.

Un Arreglo Unidimensional es una estructura de datos organizada y bien coordinada, que cuenta con una cantidad pequeña de datos, los cuales deben ser del mismo tipo para ser procesados en dicho Arreglo, en programación se usa mayormente en la creación de la estructura de listas en orden natural y totalmente con elementos similares en su interior.

TIPOS DE ARREGLOS EN PROGRAMACIÓN Y DEFINICIÓN

Una estructura de datos, es una colección de datos organizados (lógicamente) de un modo particular con el objetivo de facilitar su manipulación. Cada estructura ofrece ventajas y

desventajas en relación a la simplicidad y eficiencia para la realización de cada operación.

Los arreglos son estructuras de datos estáticas, ya que hay que declarar su tamaño antes de utilizarlos.
