Arduino based underground cable fault detection

Whenever the fault occurs in underground cable it is difficult to detect the exact location of the fault for process of repairing that particular cable. The proposed system finds the exact location of the fault. This system uses an Arduino micro controller kit and a rectified power supply. Here the current sensing circuits made

fault in the underground cables from the feeder end in few meters by using an Arduino microcontroller. The Arduino microcontroller is used to detect the changes in the output

voltage of the bridge circuit. As soon as a fault occurs in the cable, the bridge is balanced at some other resistance than the normal condition.

Automatic Cable Fault Distance Locator using Arduino

Thus the project on Underground cable fault detection using Arduino was done and the distance of the fault from the base station in kilometers was displayed for the three individual phases R,Y and B. Circuit can be tested with different resistor values to simulate various fault conditions In this project faults upto a distance of 4km can be detected. When the fault switches are operated to fault condition then the phase corresponding to that particular switch is considered as the faulty phase.

The objective of this project is to determine the distance of underground cable fault from base station in kilometers using an Arduino board. The underground cabling system is a common practice followed in many urban areas. There are many electrical, telephone and other signal cables are laid underground. Many time faults occur due to construction works and other reasons. At

that time it is difficult to dig out cable due to not knowing the exact location of the cable fault.

CABLE FAULT DETECTION using ARDUINO

CONCLUSION: The project "ARDUINO BASED UNDERGROUND CABLE FAULT DETECTION SYSTEM" has been successfully designed and tested. Integrating features of all the hardware components used have developed it. Presence of every module has been reasoned out and placed carefully thus contributing to the best working of the unit.

Arduino based Underground Cable Fault Detection. ABSTRACT. The project is intended to detect the location of fault in underground cable lines from the base station in kilometers using an Arduino board. This project uses the standard concept of Ohms law i.e., when a low DC voltage is applied at the feeder end through a series resistor to the Cable lines, then current would vary depending upon the location of fault in the short circuited cable.
