Effects Of Earthquake Ground Motion

When both seismic record sets were incrementally scaled until collapse, a slight increase in the material strains was found under the short-duration seismic events. Overall, it is indicated that ground motion duration does not influence the seismic response of low-rise buildings with low deformation capacity. 1.

Ground effects may produce appreciable differences in duration and amount of shaking even at localities only a fraction of a mile apart. The importance of selecting crystalline rock or at least dry ground and avoiding water-saturated soft ground for foundations of buildings to reduce potential earthquake damage is stressed.

When earthquake shaking occurs, a building gets thrown from side to side and/or up and down. That is, while the ground is violently moving from side to side, the building tends to stand at rest, similar to a passenger standing on a bus that accelerates quickly.

Unit2: Earthquake Effects/Building Reaction to Ground Motion

To further complicate matters, the ground motion duration itself is related to earthquake features like magnitude, distance to site, and fault type, so it is difficult to decouple the effects of duration from other earthquake and ground motion characteristics.

Effects of Earthquakes

Seismic site effects are related to the amplification of seismic waves in superficial geological layers. The surface ground motion may be strongly amplified if the geological conditions are unfavorable. Therefore, the study of local site effects is an important part of the assessment of strong ground motions, seismic hazard and engineering seismology in general. Damage due to an earthquake may thus be aggravated as in the case of the 1985 Mexico City earthquake. For alluvial basins, we may shake
