Spectrophotometric Determination Of Acetaminophen Content

An accurate and simple method is proposed for the analysis of a three-component mixture composed of acetaminophen, salicylamide and codeine phosphate, without the necessity for the previous separation of any component. The first two components are determined directly by independent spectrophotometric measurements,

A rapid method for the routine determination of acetaminophen and dichloralantipyrene in capsules is reported. The determination of acetaminophen is based on the ability of its hydrolytic product, p-aminophenol, to produce an intensive yellow color with vanillin. The determination of dichloralantipyrene is based on the fact that it, as well as its major metabolite chloral hydrate, produces a blue color with quinaldine ethiodide.

This procedure was also used for the determination of p - aminophenol in the presence of its degradation products. It was necessary, however, to separate the respective Schiff bases by TLC from the degradation products and the reaction mixture prior to spectrophotometric examination. Small amounts of p - aminophenol present in acetaminophen were quantitatively determined by applying the procedure to a water-ethanol (955 v/v) extract of the samples of acetaminophen.
