HomeProductsLow Signature Impressed Current Cathodic Protection. Overview. All vessels are susceptible to galvanic corrosion below the waterline caused by current flow in seawater between the dissimilar metals used in their construction. This can be countered by fitting sacrificial anodes close to the components susceptible to corrosion, so that these are corroded instead.

Impressed Current Cathodic Protection - Ultra Electronics

Cathodic protection is a technique used to control the corrosion of a metal surface by making it the cathode of an electrochemical cell. A simple method of protection connects the metal to be protected to a more easily corroded "sacrificial metal" to act as the anode. The sacrificial metal then corrodes instead of the protected metal. For structures such as long pipelines, where passive galvanic cathodic protection is not adequate, an external DC electrical power source is used to provide suffic
