Biology From Gene To Protein

Proteins are built using 20 units called amino-acids. Translation is the process of converting the sequence of a messenger – carrying the gene's information based on a 4-nucleotide code – into a protein sequence made of 20 amino-acids. To guide this translation, cells follow the genetic code.

In molecular biology and genetics, translation is the process in which ribosomes in the cytoplasm or endoplasmic reticulum synthesize proteins after the process transcription of DNA to

RNA in the cell's nucleus. The entire process is called gene expression.. In translation, messenger RNA (mRNA) is decoded in a ribosome, outside the nucleus, to produce a specific amino acid chain, or polypeptide.

Translation (biology) - Wikipedia

The genome holds instructions for creating and maintaining an organism, but most physiological functions involve what genes are translated into - proteins. Every cell holds the proteins that give it an identity and enable it to do its job, and all of those thousands of proteins have to work together in carefully coordinated interactions. When problems arise in

proteins, it leads to disease, so ...
