Phospholipids assemble in layers to make membranes for cell organelles. Why do phospholipids have water on the inside and outside of the membrane. Since water is both inside and outside of the membrane, the polar head of the phospholipid must face both inside and outside because this is not possible with one molecular layer.

Membranes are mosaics of structure and function. A membrane is a collage of different proteins embedded in the fluid

matrix of the lipid bilayer. Proteins determine most of the membrane's specific functions. The plasma membrane and the membranes of the various organelles each have unique collections of proteins.

This means that some molecules are able to travel through without any problem, while others need specific proteins in order to help them across. The plasma membrane allows for the creation of a concentration gradient, an essential part of many biological processes. Lysosome. The plasma membrane

This is what we call a phospholipid bilayer. This is the basic structure of a cell membrane. And like we mentioned, this inside section is going to be hydrophobic. So now we have the structure that looks kind of like this. We call this our phospholipid bilayer, or lipid bilayer for short. But doesn't this section here also interact with water?

plants, it consists mainly of cellulose secondary cell wall found between the plasma membrane and primary cell wall of plant cells; made of lignin and other proteins; acts as an extra layer of sturdy support; provides channels for the flow of water into and out of the cell.
