A formula for NPSHA can be stated as the following equation.

$NPSHA = P_{suction} - P_{saturation}$. When a centrifugal pump is taking suction from a tank or other reservoir, the pressure at the suction of the pump is the sum of the absolute pressure at the surface of the liquid in the tank plus the pressure due to the elevation difference between the surface of liquid in the tank and the pump suction less the head losses due to friction in the suction line from the tank to the pump.

Centrifugal Pumps : Principles, Operation And Design

Some of the most common pumps used for mine dewatering are submersible centrifugal pumps (pump and motor in one unit, all submerged underwater), submersible turbines (pump and motor installed in a well or cooling sleeve and submerged), and vertical turbines, either installed on a float in a pond/lake or in a well (pump end and column pipe submerged with motor mounted on a motor stool above ground/water).

Selecting Pumps for Mining Applications | Pumps & Systems

A centrifugal pump utilizes rotation to pass on velocity in the direction of the fluid. Each centrifugal pump uses a hydraulic component like an impeller that turns to pass on velocity toward the pumped fluid. This pump mainly used to change the velocity into liquid flow. Each pump uses a hydraulic component like a casing that captures the velocity which is informed by the impeller & directs the pushed fluid toward the pump expulsion end.
