Principal Component Analysis Using EViews

Principal Component Analysis: Part I (Theory) Most students of econometrics are taught to appreciate the value of data. We are generally taught that more data is better than less, and that throwing data away is almost "taboo". While this is generally good practice when it concerns the number of

observations per variable, it is not always recommended when it concerns the number of variables under consideration.

Principal Component Analysis: Part II (Practice) In Part I of our series on Principal Component Analysis (PCA), we covered a theoretical overview of fundamental concepts and discussed several inferential procedures. Here, we aim to complement our theoretical exposition with a step-by-step practical implementation using EViews.

EViews allows you to compute the

principal components of the estimated correlation or covariance matrix of a group of series, and to display your results in a variety of ways. You may display the table of eigenvalues and eigenvectors, display line graphs of the ordered eigenvalues, and examine scatterplots of the loadings and component scores. Furthermore you may save the component scores and corresponding loadings to the workfile.

Principal Components Analysis (PCA) using SPSS Statistics Introduction.

Principal components analysis (PCA, for short) is a variable-reduction technique that shares many similarities to exploratory factor analysis. Its aim is to reduce a larger set of variables into a smaller set of 'artificial' variables, called 'principal components', which account for most of the variance in the original variables.

Principal Components Analysis (PCA) using SPSS Statistics

Principal Component Analysis. PCA's approach to data reduction is to create

one or more index variables from a larger set of measured variables. It does this using a linear combination (basically a weighted average) of a set of variables. The created index variables are called components.

Principal component analysis (PCA) is the process of computing the principal components and using them to perform a change of basis on the data, sometimes using only the first few principal components and ignoring the rest. PCA is used in exploratory data analysis and for making predictive models.
